a complete information & data.

- Database

Database is a place & medium to store the data in systematic Organized manner. In Database we are using an operation is known as CRUD operations. It is an organized collection of Create, Read, Update, Delete. data that allow us to store, manage Insert, Retrieve, Modify, Drop. & retrieve data easily

DBMS (Database Management system)

- It is a software to maintain & managing the database.
- There are 2 Main features of DBMS
  1) security system. It is a software used to create, store,
  2) Authorization. manage, update & retrieve data from a database
- In DBMS software we are storing data in the form of. Ex: mysql, Oracle, sql server.
  file format.
- To communicate with DBMS, we are using query language.

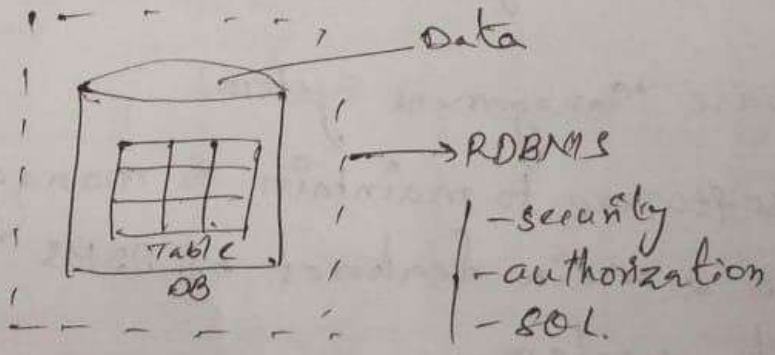

Types of DBMS software.

1. Hierarical DBMS (HDBMS) Organized in tree like structure
2. Network DBMS (NDBMS) Data organized like a network, one record can have relationship with multiple records
3. Relational DBMS (RDBMS) data stored in tables
4. Object Oriented DBMS (OODBMS) Store data in the form of objects

Company
↓
employee

- RDBMS
  - It is also one of the type of DBMS software to maintain & managing database.

    features 1. security system
    2. Authorization.
  - In RDBMS software, we are storing data in the form of table. and communicate with RDBMS we are using SQL.

- Relational Model → It is a way of organizing data using tables rows & cols.

  It is a theory designed by Data scientist EF. Codd (Codd) if any DBMS software follows this RM means it will automatically convert into RDBMS.
